This post shows a quick guide to program ESP8266 WiFi module with Arduino UNO board and how to use Arduino IDE software in order to write codes for this module. The ESP8266 board contain the microcontroller ESP8266EX (32-bit microcontroller) from Espressif Systems, this low cost Wi-Fi module is a very good choice for hobbyists to build IoT projects. IoT: Internet of Things.

Choose the ESP8266 Board and correct Port and open the Serial Monitor (115200 Baud). Type "AT" and get an "OK" back. We'll have to change the default Baud rate of the ESP with the following command:

"AT+UART_DEF=9600,8,1,0,0" (or for some versions "AT+CIOBAUD=9600").

The ESP01 module is a very sensitive improper power supply. According to the Datasheet, Esp8266 modules have an operating voltage of 3 to 3.6 volt which is about 3.3 volt plus and minus 10%. Since Arduino Uno has got a 3.3-volt pin and can be used to power other 3.3V devices, we can explore a few wiring schemes. ESP01-Pin Diagram

I want to send data from arduino to ESP8266. I have done all the RX and TX connections. The problem is that data is not sent every second, it stops after a single byte. When I remove the arduino cable then data is read. My Arduino

```
Code : void setup() { Serial.begin(9600);  
} void loop() { Serial.write("50");  
delay(1000); } My ESP8266 Code :

Serial Communication between ESP8266 and Arduino Uno ...

Start by connecting the Arduino's 3.3 volts to the breadboard's redline. At this stage, a point to note is that ESP8266 is 3.3 volts; hence, it will work with 3.3v instead of Arduino's 5 volts rating. If there are other components with a 5 volts rating, you may link them to the red line's 5V output on the breadboard.
