B. D. Guenther. Electromagnetic theory, Maxwell's equations, and Poynting's theorem are used to
derive the following properties of light waves: (1) the wave nature of light; (2) the fact that light is a
transverse wave; (3) the velocity of light in terms of fundamental electromagnetic properties of
materials; (4) the relative magnitude of the electric and magnetic fields and relationships between
the two fields; and finally (5) the energy associated with a light wave.

Huygens' Principle and on the addition of waves to calculate an interference field starting with two
apertures as in Young's two slit experiment extending to N apertures and then a continuum
distribution. A detailed look is made of the obliquity factor and a constant value is derived to be
used ...
