The Control And Treatment Of

In the design of experiments, treatments are applied to experimental units in a treatment group. In comparative experiments, members of a control group receive a standard treatment, a placebo, or no treatment at all. There may be more than one treatment group, more than one control group, or both. A placebo control group can be used to support a double-blind study, in which some subjects are given an ineffective treatment

to minimize differences in the experiences of subjects in the different gr

Treatment and control groups - Wikipedia

The control group receives either no treatment, a standard treatment whose effect is already known, or a placebo (a fake treatment). The treatment is any independent variable manipulated by the experimenters, and its exact form depends on the type of research being performed. In a medical trial, it might be a new drug or therapy.

Control Groups and Treatment Groups | Uses & Examples Taking a time-out should lead to improved communication and collaboration, whereas the silent treatment is an assertion of dominance and control. The person who is being victimized can tell the ...

The treatment group consists of participants who receive the experimental treatment whose effect is being studied (in this case, zinc tablets). The control group consists of participants who do not receive the experimental treatment being studied. Instead, they get a placebo (a fake treatment; for example, a sugar pill); a standard, nonexperimental treatment (such as vitamin C, in the zinc study); or no treatment at all, depending on the situation.
