Normally, SPSS computes a 95 per cent confidence interval for the ICC; this value can be changed via keyword CIN. Likewise, by default SPSS computes a test whether the observed ICC is significantly different from zero; keyword TESTVAL can change the value against which the observed ICC is tested (in this example, to 0.4).

In survival analysis, non-parametric approaches are used to describe the data by estimating the survival function, S(t), along with the median and quartiles of survival time. These descriptive statistics cannot be calculated directly from the data due to censoring, which underestimates the true survival time in censored subjects, leading to ...

The Kaplan-Meier estimator, also known as the product limit estimator, is a non-parametric statistic used to estimate the survival function from lifetime data. In medical research, it is often used to measure the fraction of patients living for a certain amount of time after treatment. In other fields, Kaplan-Meier estimators may be used to measure the length of time people remain ...
